The report and methodology presented here were developed by José Pineda and Gisèle Mueller under the guidance of Sheng Fulai of UN Environment's Economics and Resources and Markets Branch.

The Integrated Green Economy Framework was conceptualized and developed by José Pineda, Gisèle Mueller and Ronal Gainza under the guidance of Sheng Fulai of UN Environment's Resources and Markets Branch. Substantive technical contribution for the methodological framework and simulation of results was provided by Xin Zhou (Institute for Global Environmental Strategies), Roy Boyd (Ohio University), Maria Eugenia Ibararán (Universidad Iberoamericana Puebla) and Steven Arquitt (Millennium Institute). Nordine Bendou, Katharina Bohnenberger and Laura Russo provided excellent research assistance. This paper also greatly benefited from a workshop held in 2016 and UN Environment appreciates the technical inputs from all participants. UN Environment would also like to thank the following people, who sent written comments on a previous version of the paper, which helped to improve the final version: Nicola Cantore (UNIDO); Matthias Kern and Dorothee Georg (UN Environment); Rafael Alexandri (Subsecretaría de Planeación y Transición Energética, SENER, Mexico); Marisol Rivera; Aguirre Gómez (INECC, Mexico); Jamal Srouji (UN Environment); and Olivia Clink (UN Environment). This report was edited by Mark Bloch and designed by Thomas Gianinazzi. PAGE gratefully acknowledges the support of all its funding partners: European Union, Germany, Finland, Norway, Republic of Korea, Sweden, Switzerland and the United Arab Emirates.

European Union

PAGE is grateful to the European Union for providing the funding support to this project.

## EXECUTIVE SUMMARY

Under the Partnership for Action on Green Economy (PAGE), UN Environment collaborated with modelling experts from around the globe to develop the Integrated Green Economy Modelling (IGEM) framework that aims to better respond to countries' needs in terms of analysing the cross- sectoral impacts of Green Economy (GE) policies, so as to incorporate some of the lessons learned from the application of existent modelling tools, such as the T21 model. Therefore, the IGEM framework is designed to serve three purposes: (1) it builds on UN ENVIRONMENT's past country experience with modelling green economy policies to answer increasingly complex requests from governments; (2) it supports the endowment of countries with solid quantitative tools to inform the design and implementation of green economy policies; and (3) it advances the process of implementing and monitoring some of the Sustainable Development Goals (SDGs), adopted in September 2015.

The IGEM framework presents a methodology on how to integrate three of the main modelling techniques used for green economy policy assessment to refine impact analysis of green policies and investments in the economy. It presents the linkages between a system dynamics (SD) model and a computable general equilibrium (CGE) model, building on input- output and social accounting matrix (IO-SAM) models. The goal of the first version

policy questions. "Greening" includes modifications to the conventional models to analyse the impact on sectors that are related to the production and use of environmentally friendly goods and services, and it also includes the use of disaggregated data on these sectors. This implies making green sectors explicit and distinguishing them from other sectors which are defined based on conventional technologies and practices, as well as modifying some of the main interrelations of the model variables to better capture the impacts of green economy policies (policies inducing low carbon and resource efficient outcomes, among others).

In particular, a green IO-SAM model is featured by explicitly distinguishing the green sectors from other sectors which utilize conventional (high-carbon, less resource efficient) technologies and practices. A standard CGE model may be transformed into a "green" CGE model either by using input data on green sectors coming from the expanded IO-SAM; and/or by making specific modifications to the conventional CGE model to reflect the use of environmentally efficient technologies. These two approaches can be integrated. The System Dynamics (SD) model component of the IGEM framework can be best thought of as a SD model designed to focus on green policy analysis and to work in concert with the green CGE and green IO-SAM models. To do so, a green version of the SD model will develop the sector
