FOREWORD

The adequate availability of basic infrastructure services such as water supply and sanitation is an important contributor to health, well being and economic productivity of our society. Unfortunately, despite the efforts made during the International Drinking Water Supply and Sanitation Decade (1981-1990), some 250 million still remain unserved with water supply and 400 million without sanitation in urban areas alone. Most of them belong to urban low-income groups, the "urban poor", and continue to live in health-and life-threatening situations.

For a long time, investments in environmental infrastructure projects were influenced by the myth that the poor could not pay for the services. In reality, however, they were paying for more than their wealthier counterparts in the formal city but received much inferior services, e.g., water from vendors at exorbitant prices. Meanwhile, the provision of environmental infrastructure services has remained largely dependent on public investment and central government transfers to local authorities. In the absence of user involvement in the planning and provision of these services, relatively little attention is paid to ensure continued functioning of these services. According to one estimate, one in four water supply systems does not function at any one time and the number of those being abandoned is nearly equal to the number of new ones being commissioned. Even functional systems often remain in disuse. In some cases, two-thirds of the population, reported to have access to improved facilities, did not use them.

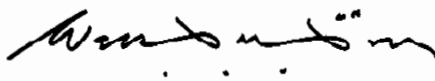

One of the factors that contribute to this situation is the general lack of information on how the communities secure water and sanitation, how much they pay for the services and how much the households are willing to pay for a better and more reliable service. In the absence of such information, infrastructure planning is usually based on assumptions made about the population to be served and per-capita consumption rates. In this top-down planning process, the tariff to be charged is usually calculated by supply-side considerations and focus on costs recovery without any realistic assessment of the affordability and willingness of the target consumers to pay for such services.

The present publication is part of the ongoing effort by UNCHS to support the implementation of Agenda 21 by enabling communities to effectively participate in service provision and management. The guidelines outlined in this publication rely on a participatory process to gather the necessary information and to mobilize the essential commitment of communities to pay for the services based on their ability and willingness. After extensive field trials, planned in 1996, these guidelines will be developed into a training manual for use by service agencies and communities.

The publication is an outcome of the ongoing UNCHS (Habitat) project aimed at developing and testing a Community-based, Environmental Management Information System (CEMIS) through field work in Accra (Ghana) and Jakarta (Indonesia). The project is being executed with financial support from Government of Denmark under the Environmental Health and Sanitation Component of the DANIDA-UNCHS Programme Agreement.

I hope the publication will be of practical use to professionals and decision-makers in governments and international agencies who are interested in pursuing a rational, demand-driven approach to the provision and management of environmental infrastructure services.

The contributions of Dr. Charles Surjadi and his team at Atma Jaya University (Indonesia), Prof. Christian M. Rogerson of the University of Witwatersrand (South Africa), Ms. Lynette Ochola of Oxfam (UK & Ireland) Kenya in contributing to the manual and Mr. André Dzikus of UNCHS (Habitat) in developing the framework for the manual and both supervising and substantively contributing to this publication are gratefully acknowledged.

Dr. Wally N'Dow
Assistant Secretary-General
United Nations Centre for Human Settlements (Habitat)

CONTENTS

FOREWORD	i
1. INTRODUCTION	1
1.1. General framework	1
1.2. CEMIS a framework for assessing effective demand	2
2. BACKGROUND: ASSESSING EFFECTIVE DEMAND	9
2.1 Summary	9
2.2 An International literature review	10
2.2.1 Introduction	10
2.2.2 Willingness to pay: the significance of the issue	11
2.2.3 Estimating willingness to pay: the contribution of water vending surveys	14
2.2.4 Contingent valuation surveys: methods and findings	17
2.2.5 Summary and conclusion	22
3. INFORMATION NEEDS AND METHODOLOGIES	24
3.1 Introduction	24
3.2 Objective	24
3.3 Strategy and outputs	24
3.4 Activity	25
3.4.1 Step 1: Review of technologies selected	25
3.4.2 Step 2: Information needs	25
3.4.3 Step 3: Methodologies	30
3.4.3.1 Community-self-survey/self-reporting	31
3.4.3.2 Community observation	36
3.4.3.3 Community group games/ranking	36
3.4.3.4 Community group discussion	39
3.4.3.5 Key person interview/ local authority/utility/ company/research institute	41
3.4.4 Step 4: Selection of most appropriate methodologies	41
4. IMPLEMENTATION PLAN FOR COLLECTING INFORMATION	43
4.1 Introduction	43
4.2 Objective	43
4.3 Strategy and outputs	43
4.4 Activities	44
4.4.1 Step 1 Division of community into neighbourhood groups	44
4.4.2 Step 2 Identification of implementation team and management structure	46
4.4.3 Step 3 Development of implementation strategy	46
4.4.4 Step 4 Evaluation of actual implementation plan	48
4.4.5 Step 5 Adoption of implementation plan	49
4.4.6 Step 6 Training of key team members	49
5. KEY PERSON INTERVIEWS WITH LOCAL AUTHORITY/WATER COMPANY/PUBLIC WATER UTILITY	50
5.1 Introduction	50
5.2 Objective	50

5.3	Strategy and outputs	50
5.4	Activities	52
5.4.1	Step 1 Identification and first contact with key person	52
5.4.2	Step 2 Develop guidelines for the key person interviewers	53
5.4.3	Step 3 Conduct interviews and collected data	55
5.4.4	Step 4 Store and analyse data	55
5.4.5	Step 5 Provide data for module IV and V	56
6.	COMMUNITY SELF-SURVEY/SELF-REPORTING	
6.1	Introduction	57
6.2	Objective	57
6.3	Strategy and outputs	57
6.4	Activities	58
6.4.1	Step 1: Training of surveyors	59
6.4.2	Step 2: Drawing up of questionnaire	60
6.4.3	Step 3: Pilot-testing of questionnaire and evaluation	61
6.4.4	Step 4: Data collection/execution of survey	61
6.4.5	Step 5: Data storing and cleaning	62
6.4.6	Step 6: Data analysis	63
6.4.7	Step 7: Data presentation and interpretation	63
7.	COMMUNITY GROUP ACTIVITIES	
7.1	Introduction	64
7.2	Objective	64
7.3	Strategy and outputs	64
7.4	Activities	65
7.4.1	Step 1: Training of facilitators	65
7.4.2	Step 2: Preparing and conducting community group activities	65
7.4.3	Step 3: Documenting, storing and analysing information	68
8.	CONSENSUS BUILDING AND COMMUNITY CONTRACTS	
8.1	Introduction	69
8.2	Objective	69
8.3	Strategy and outputs	69
8.4	Activities	70
8.4.1	Step 1: Analyse and present information	70
8.4.2	Step 2: Discuss findings	71
8.4.3	Step 3: Conflict resolution and consensus building	71
8.4.4	Step 4: Agreement and community contract	71
REFERENCES		73

ANNEXES

Annex 1:	Management structure	77
Annex 2:	Participatory planning method	82

Annex 3:	Guides for a questionnaire with the public water company with Jakarta including a sample questionnaire	88
Annex 4:	Information gathered during an interview with the public water company in Jakarta on tariffs and costs related to water	90
Annex 5:	Guidelines on how to conduct an interview	96
Annex 6:	How to design a questionnaire	98
Annex 7:	Sample cartoon questionnaire for community self-survey	100
Annex 8:	Sample questionnaire and how to record and tabulate data	102

LIST OF FIGURES, BOXES AND TABLES

List of figures

Figure 1	CEMIS framework	3
Figure 2	Framework of assessing effective demand	5
Figure 3	Detailed framework for assessing effective demand	6
Figure 4	Five steps of a community self-survey in Kenya	33
Figure 5	Housecard in Indonesia	35
Figure 6	Example of formal and informal administrative level structure in urban Indonesia	45
Figure 7	Data collection and analysis	62

List of boxes

Box 1	Differentials in the cost of water	9
Box 2	Key questions raised when gathering information on assessing effective demand for water	27
Box 3	Contingency valuation method: Willingness to pay for water in Jakarta (Indonesia)	38
Box 5	Example of bidding game	68
Box 6	Considerations for a community agreement/contract	72

List of tables

Table 1	Typical costs of different water supply technologies	26
Table 2	Preferred methodologies for collecting information	31
Table 3	Example of the selected most appropriate methodology	42
Table 4	Tasks of team members	42
Table 5	Sample implementation plan for community self-survey	48
Table 6	SWOT analysis of new piped water in Jakarta (Indonesia)	49
Table 7	Main sources and types of information	51
Table 8	Example of questions for the selected key information	54
Table 9	Example of voting for type of water connection	66
Table 10	Example of ranking water technologies	67
